

Generative vs Discriminative

MIT

2022

Idea of generative models

Idea of discriminative models

Plato: *"A human is featherless biped"*

Sometimes it's easier to solve a target problem (i.e. classification, regression) than describe the analyzed object nature.

Generative and discriminative models

Discriminative models

Model: $p(y|x)$.

Generative models

Model: $p(y, x)$.

Why generative models:

- When dataset generation is a target problem
- Synthetic dataset generation
- Latent properties obtaining

Model selection: coherent Bayesian inference

First level: find optimal parameters:

$$w = \arg \max \frac{p(\mathcal{D}|w)p(w|h)}{p(\mathcal{D}|h)},$$

Second level: find optimal model:

Evidence:

$$p(\mathcal{D}|h) = \int_w p(\mathcal{D}|w)p(w|h)dw.$$

What is \mathcal{D} for generative and discriminative models? Why?

Plate notation

Plate notation is an alternative visualization for graphical models.

Elements:

- White circles (random variables);
- Grey circles (observed variables);
- Small circles (deterministic values);
- Plates (batching).

Plate notation for linear regression (Bishop)

Plate notation: discriminative and generative models

Discriminative models:

- Generate (or deterministically obtain!) x
- Generate w
- Generate $Y \sim p(y|X, w)$

Generative model:

- Generate y
- Generate w
- Generate $x \sim p(X|y, w)$

Generative unsupervised model:

- Generate w
- Generate $x \sim p(X|w)$

Generative models and unsupervised learning

Are the generative models always unsupervised?

Generative models and unsupervised learning

Are the generative models always unsupervised?

No! Linear classification is an example

Logistic regression:

$$E(y|X) \equiv g^{-1}(Xw),$$

$$g^{-1}(x) \frac{e^x}{1 + e^x} \in [0, 1]$$

The decision function is a sigmoid.

Generative model:

$$p(y = 1|x, w) = \frac{p(x|w, y = 1)p(y = 1)}{\sum_{k=0}^1 p(x|w, y = k)p(y = k)},$$

$$p(x|w, y = k) \sim \mathcal{N}(w_m^k, w_s^k).$$

The decision function is a sigmoid.

Discriminative + generative

Naive approach: introduce a prior on class labels

$$p(x, y|w) = p(y|w_y)p(x|y, w_x).$$

Two optimization functions:

$$L_G = p(w) \prod_{x,y} p(x, y|w),$$

$$L_D = p(w) \prod_{x,y} p(y|x, w).$$

Combine them:

$$\lambda L_G + (1 - \lambda)L_D \rightarrow \max.$$

This optimization is heuristic, it does not give us ML results, nor MAP.

Discriminative + generative

(Bishop et al., 2007): introduce two probabilistic models: “discriminative” and “generative”:

$$p(x, y|w_G, w_D) = p(y|x, w_D)p(x|w_G)p(w_G, w_D).$$

Optimization:

$$p(w_G, w_D) \prod_{x,y} p(y|x, w_D)p(x|w_G).$$

How to select $p(w_G, w_D)$?

- $p(w_G, w_D) = p(w_G)p(w_D)$: obtain L_D ;
- $p(w_G, w_D) = p(w_G)\delta(w_G - w_D)$: obtain L_G ;
- Trade-off: $p(w_G, w_D) \propto p(w_G)p(w_D)\exp(-\frac{1}{2\sigma^2}\|w_G - w_D\|^2)$.

Discriminative + generative

(Bishop et al., 2007): example of different combinations of these optimizations for the synthetic dataset. The dataset contains only 2 labeled objects for each class.

$\alpha = 0$ - generative case

$\alpha = 0.4$

$\alpha = 0.6$

$\alpha = 0.7$

$\alpha = 0.8$

$\alpha = 1$ - discriminative case

VAE: generation process

(a) Learned Frey Face manifold

(b) Learned MNIST manifold

Semi-supervised VAE (Kingma et al., 2014)

$$\text{M1: } q_{\phi}(\mathbf{z}|\mathbf{x}) = \mathcal{N}(\mathbf{z}|\boldsymbol{\mu}_{\phi}(\mathbf{x}), \text{diag}(\boldsymbol{\sigma}_{\phi}^2(\mathbf{x}))), \quad (3)$$

$$\text{M2: } q_{\phi}(\mathbf{z}|y, \mathbf{x}) = \mathcal{N}(\mathbf{z}|\boldsymbol{\mu}_{\phi}(y, \mathbf{x}), \text{diag}(\boldsymbol{\sigma}_{\phi}^2(\mathbf{x}))); \quad q_{\phi}(y|\mathbf{x}) = \text{Cat}(y|\boldsymbol{\pi}_{\phi}(\mathbf{x})), \quad (4)$$

For this model, we have two cases to consider. In the first case, the label corresponding to a data point is observed and the variational bound is a simple extension of equation (5):

$$\log p_{\theta}(\mathbf{x}, y) \geq \mathbb{E}_{q_{\phi}(\mathbf{z}|\mathbf{x}, y)} [\log p_{\theta}(\mathbf{x}|y, \mathbf{z}) + \log p_{\theta}(y) + \log p(\mathbf{z}) - \log q_{\phi}(\mathbf{z}|\mathbf{x}, y)] = -\mathcal{L}(\mathbf{x}, y), \quad (6)$$

For the case where the label is missing, it is treated as a latent variable over which we perform posterior inference and the resulting bound for handling data points with an unobserved label y is:

$$\begin{aligned} \log p_{\theta}(\mathbf{x}) &\geq \mathbb{E}_{q_{\phi}(y, \mathbf{z}|\mathbf{x})} [\log p_{\theta}(\mathbf{x}|y, \mathbf{z}) + \log p_{\theta}(y) + \log p(\mathbf{z}) - \log q_{\phi}(y, \mathbf{z}|\mathbf{x})] \\ &= \sum_y q_{\phi}(y|\mathbf{x}) (-\mathcal{L}(\mathbf{x}, y)) + \mathcal{H}(q_{\phi}(y|\mathbf{x})) = -\mathcal{U}(\mathbf{x}). \end{aligned} \quad (7)$$

The bound on the marginal likelihood for the entire dataset is now:

$$\mathcal{J} = \sum_{(\mathbf{x}, y) \sim \tilde{p}_l} \mathcal{L}(\mathbf{x}, y) + \sum_{\mathbf{x} \sim \tilde{p}_u} \mathcal{U}(\mathbf{x}) \quad (8)$$

Semi-supervised VAE (Kingma et al., 2014)

Algorithm 1 Learning in model M1

```
while generativeTraining() do
   $\mathcal{D} \leftarrow \text{getRandomMiniBatch}()$ 
   $\mathbf{z}_i \sim q_\phi(\mathbf{z}_i|\mathbf{x}_i) \quad \forall \mathbf{x}_i \in \mathcal{D}$ 
   $\mathcal{J} \leftarrow \sum_n \mathcal{J}(\mathbf{x}_i)$ 
   $(\mathbf{g}_\theta, \mathbf{g}_\phi) \leftarrow (\frac{\partial \mathcal{J}}{\partial \theta}, \frac{\partial \mathcal{J}}{\partial \phi})$ 
   $(\theta, \phi) \leftarrow (\theta, \phi) + \Gamma(\mathbf{g}_\theta, \mathbf{g}_\phi)$ 
end while
while discriminativeTraining() do
   $\mathcal{D} \leftarrow \text{getLabeledRandomMiniBatch}()$ 
   $\mathbf{z}_i \sim q_\phi(\mathbf{z}_i|\mathbf{x}_i) \quad \forall \{\mathbf{x}_i, y_i\} \in \mathcal{D}$ 
   $\text{trainClassifier}(\{\mathbf{z}_i, y_i\})$ 
end while
```

Algorithm 2 Learning in model M2

```
while training() do
   $\mathcal{D} \leftarrow \text{getRandomMiniBatch}()$ 
   $y_i \sim q_\phi(y_i|\mathbf{x}_i) \quad \forall \{\mathbf{x}_i, y_i\} \notin \mathcal{O}$ 
   $\mathbf{z}_i \sim q_\phi(\mathbf{z}_i|y_i, \mathbf{x}_i)$ 
   $\mathcal{J}^\alpha \leftarrow \text{eq. (9)}$ 
   $(\mathbf{g}_\theta, \mathbf{g}_\phi) \leftarrow (\frac{\partial \mathcal{L}^\alpha}{\partial \theta}, \frac{\partial \mathcal{L}^\alpha}{\partial \phi})$ 
   $(\theta, \phi) \leftarrow (\theta, \phi) + \Gamma(\mathbf{g}_\theta, \mathbf{g}_\phi)$ 
end while
```

Semi-supervised VAE (Kingma et al., 2014)

Table 1: Benchmark results of semi-supervised classification on MNIST with few labels.

N	NN	CNN	TSVM	CAE	MTC	AtlasRBF	M1+TSVM	M2	M1+M2

3000	6.04	3.35	3.45	3.22	2.57	–	3.49 (± 0.04)	3.92 (± 0.63)	2.18 (± 0.04)

Idea of discriminative models

Model selection problem: recap

First level: find optimal parameters:

$$w = \arg \max \frac{p(\mathcal{D}|w)p(w|h)}{p(\mathcal{D}|h)},$$

Second level: find optimal model:

Evidence:

$$p(\mathcal{D}|h) = \int_w p(\mathcal{D}|w)p(w|h)dw.$$

Model selection problem: recap

Can we generate target models parameters using a generative model?

Model selection: hybrid approach

Definition

Given a set Λ .

Hypernetwork is a parametric mapping from Λ to set \mathbb{R}^n of the model f parameters:

$$G : \Lambda \times \mathbb{R}^u \rightarrow \mathbb{R}^n,$$

where \mathbb{R}^u is a set of hypernetwork parameters.

Model selection: discriminative approach

$$w_{\text{MOE}} = \langle \gamma(x), [w_1, \dots, w_n] \rangle$$
